

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1-47. (Canceled)

48. (Currently Amended) A telecommunications connection process for a bandwidth-on-demand network, the process comprising:

~~wherein an~~controlling, via an application server, ~~controls use of a specified application~~
for delivering data to a user on request; ~~and wherein~~

making connections are made available at a first bandwidth and one or more higher
bandwidths; and, wherein

applying a billing process is applied to connections established at the higher bandwidths
but not at the first bandwidth, to generate a billing output, and wherein the billing process
records connections established on the network, and also records which ~~of these connections~~
using one of the higher bandwidths make use of the specified application so that the billing
process charges ~~these connections~~ using one of the higher bandwidths which make use of the
specified application at a first charge rate and charges these connections using one of the higher
bandwidths which do not make use of the specified application at a second charge rate that is
different from the first charge rate.

49. (Canceled)

50. (Previously Presented) A process according to claim 49, wherein a charge is also made to a second account when a connection is made making use of the said application server.

51. (Previously Presented) A process according to claim 50, wherein the charges to be made to the second account are determined by the information transmitted to the application server by the end users.

52. (Previously Presented) A process according to claim 48, wherein the application server logs the activities of the end users and the information provided by the end users to determine the output to be generated.

53. (Previously Presented) A process according to claim 48, wherein the end users interact with the application server such that the application server can log the activities of the end users.

54. (Previously Presented) A process according to claim 48, wherein the application server is a peer-to-peer file transfer controller.

55. (Previously Presented) A process according to claim 54, wherein the controller has means for recording user inputs relating to the quality of files available for transfer.

56. (Previously Presented) A process according to claim 55, wherein the outputs are adjusted according to the rated quality of the information accessed.

57. (Currently Amended) A billing process for a bandwidth-on-demand network, the process comprising:

recording, via ~~wherein~~ a billing engine, ~~records~~ connections established on the network;
and

controlling, via an application server, ~~controlling~~ use of a specified application for delivering data to a user on request, ~~and also~~

~~records~~ recording which of those connections established on the network ~~using~~ made use of that application, and

~~instructs~~ instructing the billing engine which connections made use of that application, and

wherein ~~such~~ connections using one of higher bandwidths are charged by the billing engine at different rates according to whether ~~these~~ connections using one of the higher bandwidths make use of that application so that which of the different rates charged by the billing engine depends on whether or not that connection using one of the higher bandwidths makes use of that application, wherein connections are made available at a first low-bandwidth and at least one of the higher bandwidths, ~~and the billing process is only applied to connections established at the higher bandwidths~~ and the application of different rates dependant on the application used is only applied to connections established at the higher bandwidths.

58. (Currently Amended) A process according to claim 57, wherein connections using one of the higher bandwidths making use of the application are charged at a lower rate than other connections using one of the higher bandwidths but not making use of the application.

59. (Previously Presented) A process according to claim 57, wherein a charge is also made to a second account when a connection is made making use of the said application server.

60. (Previously Presented) A process according to claim 59, wherein the charges to be made to the second account are determined by the information transmitted to the application server by the end users.

61. (Previously Presented) A process according to claim 60, wherein the application server logs the activities of the end users and the information provided by the end users to determine the charges to be made to the second account.

62. (Previously Presented) A process according to claim 60, wherein the end users interact with the central application server using programming information having security measures to allow the central server to log the activities of the end users.

63. (Previously Presented) A process according to claim 57, wherein the application server is a peer-to-peer file transfer controller.

64. (Previously Presented) A process according to claim 63, wherein the controller has means for recording user inputs relating to the quality of files available for transfer.

65. (Previously Presented) A process according to claim 64, wherein the call charges are adjusted according to the rated quality of the information accessed.

66-74. (Canceled).
